Plain Strip & Pads

SK plain strips and pads are made up of natural rubber compound to latest standard EN1337-3. These bearings are made without any reinforcing plates and are not recommended for high loads and bridge structures. SK strips and pads are available in 2 metre lengths with wide range of widths and thickness which provides heavy duty load carrying capacity and allows small deflection and rotation, as these are only suitable for low pressure and static loads.

Our SKT plain strips and pads have a good resistance against change in temperature and other parameters such as ozone, UV and chemicals. These are also suitable to isolate and minimize undesirable structural borne vibrations and sound with applications ranging from cinema floors, universities, leisure center, auditoriums to concert halls.

A general choice and standard sizes with thickness are shown in technical brochure based on information typically available at the onset of a project. The rubber strip and pads are also available in non-standard sizes and thickness with slots or holes for specific applications. We recommend contacting technical department, where we can identify suitable sizes based on given information and can provide supporting data sheet to EN1337-3.

Product Code

Typical reference: T0400x0200x25.

T = SKT type bearings.
0400 = Transverse dimension mm.
0200 = Longitudinal dimension mm.
25 = Thickness mm.
