

Retread

When considering footpath and carriageway maintenance requirements, Highway Engineers now more than ever have to consider environmental factors as well as economic ones.

Retread is ideal for surfaces that have exceeded their useful life and demand more than just surface treatment. It is an effective rehabilitation process that recycles in situ materials recovered from damaged carriageways, maximising the use of existing materials and reducing to a minimum the amount of new materials imported onto site. For the client, Retread is a favourable solution due to its low carbon output.
