

Multipatcher

The Multipatchers are new, innovative machines that are now the benchmark for machinery providers to aspire to. Multipatchers patch, seal and repair damaged roads all in the same vehicle, operated from the cab, by just the driver.

Using a "wheel level" remotely operated patching boom at the front and an in-cab adjustable chip spreader at the rear, we are now able to have our workforce repair potholes, seal strips or half widths of carriageways, repair haunches or rutted roads on just a single person crew.

Through design and engineering we have eliminated the need for operatives to be in the carriageway, under the cost of full traffic management, when making temporary road repairs. Because of the speed which the machine allows us to work, the Multipatcher's are capable of patching approximately 30 metres of road in under three minutes.

All data is stored on the onboard CPU to provide material usage, GPS location for auditing and before/after images for invoicing, overlaid on to a mapping service.
