## Is Re-flow's PAS 2080 module a good fit for you in your role?

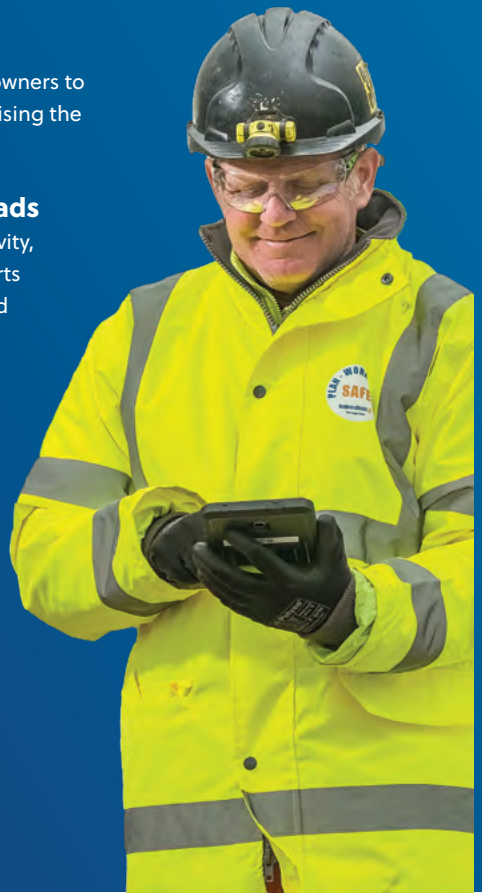

**Board and business owners**
Clear, consistent carbon reporting allows boards and owners to prove a higher standard of operations with clients – raising the standard against competitors.

**Environmental, sustainability, and PAS leads**
Carbon data is built up from everyday operational activity, removing the need to chase information or build reports from scratch. The data is clear, detailed, consistent, and ready for audit.

**Commercial and bid teams**
Estimates are generated from real job inputs, supporting more informed decisions at tender stage.

**Supervisors and site teams**
Nothing new to learn or fill in. Work life continues without disruption. Carbon data is captured through normal job activity.

**Auditors and reviewers**
Carbon reports are traceable back to source data, with a clear methodology and audit trail.

## PAS 2080 carbon compliance that takes care of itself

Re-flow® Field Management

Re-flow's PAS 2080 module for carbon management is designed to anchor carbon reporting directly to live operations – using the data teams already generate as work is planned, delivered, and completed.

# Carbon reporting:

## where rising expectations meet outdated processes

**Much of the supply chain are still struggling to meet carbon reporting expectations from clients.**

Some organisations aren't doing very much at all, others rely heavily on manual input and spreadsheets – with carbon leads wasting time chasing depots, following up suppliers, and reformatting responses just to assemble a usable picture.

But in a market where finances are often tight and competition for work is intense, continuing with stop-gap or improvised approaches is becoming an increasingly difficult position to justify.

This impacts audit exposure, the strength of bids, and the time of everyone involved in pulling the data together.

## How Re-flow helps

Re-flow Field Management links scheduling, jobs, assets, materials, plant, and transport in one connected platform – built for the daily reality of UK infrastructure businesses across highways, civils, commercial landscaping, and utilities.

The PAS 2080 module runs within Re-flow, using the operational data your teams already generate. If you're up and running with Re-flow, there's nothing new for your field teams to learn or maintain – carbon compliance becomes an organic part of how you already work.

# PAS 2080 module features

### Pre-job carbon estimation

Forecast emissions for a job based on items and resources.

### Editing and nuance in reporting

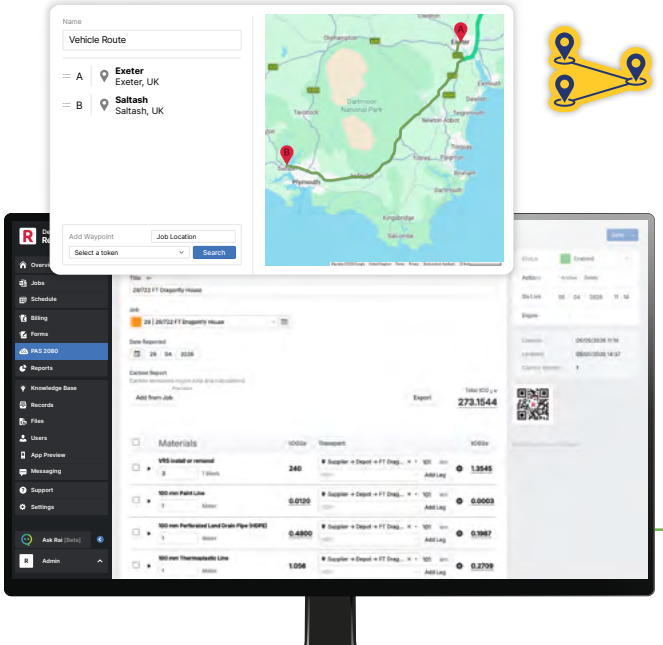

Flexible reporting helps fill in missing supplier data and complicated usage scenarios.

### Item and asset carbon scoring

Assign carbon scores to your items within Re-flow, either manually or from your chosen industry standard.

### Whole-job carbon cost

Generate a full report based on detailed actuals, from plant and equipment usage to vehicle mileage and wastage.

### Route planning

Mileage to site is captured through route plans, generating carbon calculations for resources and supplier deliveries.
